ABSTRACT

Method of modulation and demodulation of a digital signal, in particular in a frequency band affected by flat fading, associated modulator and demodulator

Broadcasting on the FM band presents a major drawback in respect of digital transmission by virtue of a propagation problem called spatial fading or flat fading. The invention proposes a \underline{A} method of modulating a digital signal of width L in frequency on a given useful frequency band is described characterized in that it comprises the following steps: comprising:[[]] a separation of the \underline{The} digital signal is separated into N blocks b_n ($1 \le n \le N$). [[,]] [[-]] a splitting of the \underline{The} given useful frequency band is split into N contiguous parts P_n [[,]]. [[-]] a definition of channels $\underline{Channels}$ \underline{Cn} , of width \underline{In} in frequency, lying within an associated part \underline{Pn} , are defined. [[the]] \underline{The} channels \underline{Cn} being are separated, [[-]] a distributing of each block of digital signals \underline{bn} over the associated channel \underline{Cn} .
